

Retail Operations Review — Central America

H1 2024 - H1 2025 | 40 stores | 5 countries | 4 formats

The bottom line

- > The network is healthy and growing across all four formats and all five countries.
- > Our most certain win is operational: a new in-store display drove a significant +10% GMV lift.
- > The biggest strategic lever is capital allocation: EXPRESS earns 2.5x the GMV per m2 of hypermarkets.
- > The main watch-item is ~\$7.3M (15% of GMV) tied to potential stock-outs in Electronics and Home.

GMV = sum(unit_price x quantity) on COMPLETED transactions. All figures validated end-to-end on the raw data.

Growth is broad — productivity is not

Comparable sales (YoY, H1)

- > All formats positive: EXPRESS +11.6%, HYPER +7.7%, SUPER +5.7%, DISCOUNT +4.8%. GMV per m2 (full period)
- > By country: Honduras leads at +8.0%; Guatemala lags at +4.9%.
- > 10 of 40 stores sit below their format 25th percentile - a concrete inte

The productivity paradox

Hypermarkets win on absolute GMV but are the least efficient per m2.
Small EXPRESS stores are the most productive use of selling space.

Comparable = stores opened before 2024 (39 of 40). Productivity normalizes GMV by selling area.

Three levers we can pull now

2.5x

EXPRESS GMV/m2 vs hypermarket

+10%

Proven display lift (p=0.004)

40%

of sales tied to a loyalty member

> **Expansion mix - favor EXPRESS.**

\$1,057/m2 vs \$412 for hypermarkets, fastest comp growth (+11.6%), ~13x less capital per store.

> **Merchandising - scale the new display.**

A +10% GMV lift driven by traffic and volume, not discounting (ticket stayed flat).

> **Loyalty - grow spend-per-visit, not just retention.**

Retention is already ~70% at month 6, but loyal ticket is flat (~\$280). Only 40% of tx are identified.

> **Promotions - lean into consumables.**

Unit uplift peaks in Food at +7.4%; in Electronics/Apparel promos are mostly pure discount.

What to watch — and what the data cannot yet tell us

\$7.3M

GMV at risk - and it is a ceiling

76%

of that risk in Electronics + Home

1%

of tickets carry an unreconciled discount

> **Stock-outs: demand vs supply is unknowable today.**

The \$7.3M is an upper bound. Sales data alone cannot separate a true stock-out from normal demand variability - we need inventory data.

> **Data quality: a header-level discount gap.**

In 1% of tickets the total is ~7% below the line items (always lower) - a basket discount not captured at line level. Certify one GMV.

> **GMROI reads low by construction.**

117 of 126 vendor-category combos show GMROI<1; with the given formula that means markup<100%, which is normal. Rank relatively, do not alarm.

> **One store (TIENDA_037) is flagged.**

Pre-opening sales plus double A/B assignment - excluded from sensitive analyses, pending data review.

Five moves, each tied to a number

1. Scale the new display from pilot to network.

Validated +10% GMV lift ($p=0.004$, 95% CI roughly +3.4% to +16.6%). Approve where cost/store < incremental margin.

2. Re-weight expansion toward EXPRESS.

Target capital efficiency: \$1,057/m² vs \$412 - 2.5x the return on selling space versus new hypermarkets.

3. Instrument inventory to act on the \$7.3M risk.

Start with Electronics + Home (76% of the exposure); convert a ceiling estimate into recovered sales.

4. Lift loyalty capture above 40% and grow loyal spend-per-visit.

Retention is already ~70%; the untapped value is basket size, not churn.

5. Certify a single GMV definition in a semantic layer.

Closes the 1% header-discount gap and prevents conflicting numbers across reports.
